SYKEHUSET I VESTFOLD

Hva er det som går?

Oppdatert 05.05.2025

Om rapporten

Diagrammene viser forekomst av luftveisvirus, atypiske luftveisbakterier, gastroenterittvirus og encefalittvirus i prøver analysert ved mikrobiologisk avdeling, Sykehuset i Vestfold. Avdelingen mottar og analyserer prøver fra pasienter i og utenfor sykehus i Vestfold og Telemark.

Speedometer-diagrammene (side 2) gir et oppdatert øyeblikksbilde av aktivitet for hver enkelt mikrobe (andel positive prøver siste 7 døgn).

De kombinerte søyle- og linjediagrammene viser antall positive (søyler) og andel positive (linjer) prøver per mikrobe per uke siste år. I tillegg vises totalt ukentlig antall analyserte prøver som grå søyler.

Ukesrapporter publiseres på SiVs internettsider: [Hva er det som går?]

For nasjonale overvåkingsdata, se FHI: [Statusrapporter luftveisinfeksjoner]
